Roll Services for Oilseed Flakers

For Bühler and other flaker brands

Bühler Flaker Roll Services

Bühler's on-site roll regrinding service helps restore roll performance, reduce unplanned downtime, and extend component lifetime. For stable operation, consistent flake thickness, and optimum extraction yield we can provide a one-time regrind, recurring inspection support, or a long-term service partnership.

Precision On-Site Roll Grinding for Reliable Performance
Our specialists determine the proper grinding approach based on the condition of your rolls – either full-face grinding or end relief – to optimize roll performance and support consistent flake quality.

01 **Roll inspection**
Surface hardness testing; check for chipping, pitting, and cracking

02 **Precision grinding**
Rolls are ground to customer specifications using either Bühler's grinding equipment and roll slow-down capabilities or the customer's onsite tools

03 **Final inspection and documentation**
Quality check with full reconditioning records

Value for your operation:

- Expertly reconditioned rolls
- High throughput and improved operating reliability
- Consistent flake thickness and stable extraction performance
- Reduced maintenance costs
- Reduce roll damage
- Improved uptime and predictable maintenance planning

Bearing Replacement
Optional bearing replacement improves operational reliability and production safety. This is strongly recommended as bearings are designed for a limited number of production hours.

Innovations for a **better world.**

BÜHLER

Bühler Roll Conditioning:
Flexible agreements. Expert execution. Reliable performance.

Bühler Roll Care Package

Our Roll Care package provides proactive maintenance through a defined number of on-site inspections and reconditioning services.

Packaged options include:

- Monthly installments
- Annual renewal
- On-site Bühler specialist support

Why Bühler

Bühler combines deep application knowledge with flexible service models and proven reconditioning capabilities. While onsite, our technicians can also inspect additional machine components and process conditions to help identify potential issues and improvement opportunities.
