

The image features a large industrial die casting machine, the Bühler Ecoline DS 90, which is white with green accents. It has a large front door with the 'BÜHLER' logo and 'Ecoline DS 90' text. To the left, a green hydraulic cylinder is visible with black hoses. The background is a light blue and green gradient with abstract shapes. The text is overlaid on a semi-transparent white box on the left side of the machine.

Bühler Ecoline DS

**Efficient solutions

die-casting
products**

Efficient solutions for high-quality products

Die casting with confidence

The Ecoline DS is a cold-chamber die-casting machine with locking forces ranging from 3,400 to 9,000 kN, particularly well-suited for casting aluminum and magnesium.

8

Available with ServoDrive

- Frequency-controlled motor combined with a multi-stage fixed displacement pump
- Save up to 30% electrical energy consumption
- Increased lifetime of the components due to reduced operating hours of the drive unit

7

Robust hydraulic system

- Reliable and proven hydraulic system
- Inline gear pump with energy-efficient drive
- Suction and return filters increase lifetime of hydraulic components
- 210 bar system pressure

1

Easy-to-use control panel

- Up to 5 % faster programming with object-oriented graphical user interface
- Outstanding diagnostics for fast troubleshooting and data analysis
- Up to six months data traceability
- Data sharing with OPC and external networks
- On-screen maintenance hints enable easy troubleshooting and process optimization

2

Peripheral integration for total cell control

- Fully-integrated peripherals optimize production and enable shorter cycle times
- Pre-saved die programs speed up production start-up and die changes

3

Powerful injection unit for up to 5% less scrap

- 210 bar hydraulic pressure increases system dynamic
- Real-time shot control ensures high repeatability
- Integrated intensifier reduces pressure build-up time
- Multi-step injection curve including braking function increases die lifetime and reduces flash
- Fill test delivers exact injection curve setup

4

Automatic tie bar withdrawal for easy die change

- Completely retractable tie bars
- Automatic operation, monitored by the control system

5

Reliable closing unit

- 3-platen toggle system proven across 3,000+ installations
- Powerful hydraulic double-cylinder ejector for parallel ejection of parts
- Core pull on movable and fixed platen provides ultimate flexibility

6

Integrated control cabinet

- State-of-the-art interfaces for a wide range of peripherals
- Proven WAGO terminals
- Latest KEBA hardware
- Pre-wired cabinet for reduced installation time

Reliable and precise for consistent results

State-of-the-art technology

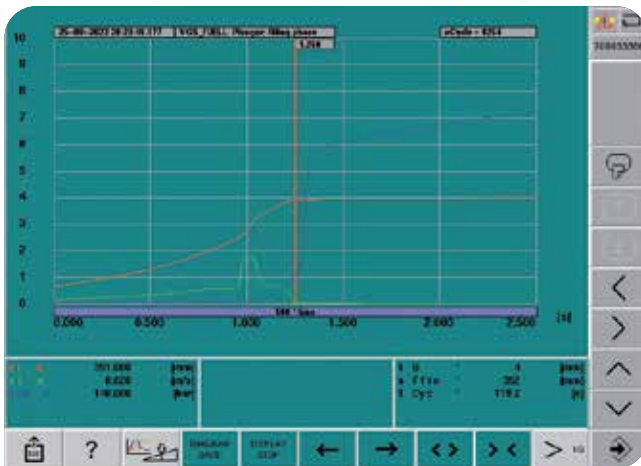

High-performance injection unit

Die-filling at high speed and extreme pressure is a foundational requirement for today's complex die castings. With Ecoline DS, state-of-the-art proportional technology controls the high-power injection unit during the second phase to overcome process variations and deliver high quality for your produced parts. First phase optimization algorithms minimize air entrapment and regenerative hydraulics saves energy at the same time.

Easy-to-use control system

Bühler die-casting machines combine leading-edge technology with excellent automation solutions. Hardware and software simplify the die-casting process, so operation is easier than ever. The integrated touchscreen operator terminal connects the user to the casting process through intuitive screens for setup and monitoring. The graphical user interface is customized for your precise requirements and provides helpful functions throughout the entire production process.

Decades of know-how in assistance systems

Assistance systems make it possible to fill dies with minimal air entrapment. This increases productivity by as much as five percent. In addition, the system determines the best pre-filling profile at the touch of a button, eliminating the need for complicated injection curve optimization. Your operators can still adjust the filling profile as they wish with Bühler's Multistep technology. Digital recording of the plunger movement allows precise monitoring and control of the casting process. Finally, closed loop control on the Ecoline DS brings you consistent results – from cycle to cycle.

Up to
5%

Increased productivity due to optimized first phase

Proven toggle system

The 3-platen locking system on the Ecoline DS has already proven itself in over 3,000 die-casting applications worldwide. The toggle system ensures fast movements with an evenly distributed locking force. The tie-bars with special Bühler thread design allow for consistent production with minimum downtime and low maintenance.

Expertise you can rely on Bühler Die Casting services

Your Bühler die-casting solution comes with digital services tailored to your precise needs, ensuring you get maximum efficiency from your cell.

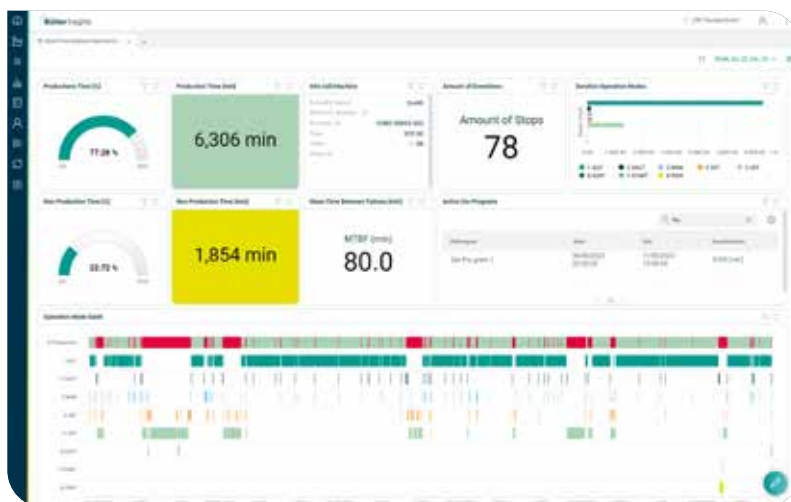

Die Casting Dashboard

The Ecoline DS displays real-time data, enabling you to keep an eye on your die-casting machine, the whole cell and even the entire foundry.

Downtime Analysis

Downtime Analysis helps you to determine the cause of interruptions in your die-casting process and gives you the information you need to continuously improve production.

Global setup

With over 100 service stations worldwide, Bühler is never far away, supporting you from installation to production, as well as fast spare and wear parts delivery and local service availability.

myBühler

The instantly available myBühler digital overview provides useful information, including essential documents such as user manuals and 3D spare parts catalogs, as well as easy spare parts ordering.

Application technology and education

Our highly qualified staff can help you to get the most from your investment and optimize performance, with:

- A wide choice of training courses every year – at dedicated centers, online or directly at your site
- Process optimization support to help drive up your OEE, from production start-up to fine-tuning during operation
- Consulting to help you troubleshoot issues, consider future strategies and embrace industry trends

For maximum productivity Integrated cell solutions

Central automation solution

The die-casting machine, sprayer, ladler and extractor are centrally operated and monitored. With all the peripheral movements perfectly in sequence with the die-casting machine, cycle time can be optimized and the uptime increased.

There is no need for complicated interfaces. Your cell can be programmed and operated by the machine control system. All settings are stored within the die program, reducing downtime for your production changes. It also ensures stable quality of your casted parts and delivers a predictable productivity level.

Thought through and aligned

Integrated peripherals for optimal results

Consistent ladling

The BRL Servo metal ladle offers quick movements to minimize your cycle time and provide precise positioning for accurate dosing. Meticulous control of the ladle function ensures stable production. Robust, low-maintenance mechanical systems form the basis for continuous operation.

Reliable extraction

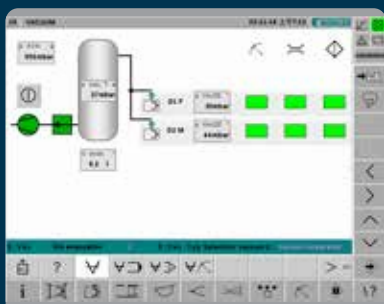

The BE-C Servo extractor grips the castings with pinpoint accuracy and carefully sets them down. The servo drive technology allows quick movements and freely programmable waiting positions prior to extraction, saving valuable cycle time.

The integrated parts inspection provides additional transparency to the process and helps to avoid un-scheduled interruptions of your production.

Optimum spraying

Even your most complex casting shapes can be completely sprayed out with the BP-XL Servo sprayer. This is made possible by four spray-blow circuits as well as two independent high pressure blowing circuits. The dynamics of the Servo drive technology ensure that cycle times are kept to a minimum.

SmartVac – vacuum system with higher process transparency

The SmartVac vacuum system is integrated seamlessly into the die-casting system, controlled centrally from your Ecoline DS control unit. All relevant vacuum parameters are measured, monitored and assigned to the process directly – for comprehensive process transparency and optimum quality of your components. The SmartVac standard version allows the use of thermally self-locking valves, so called chill blocks, at a maximum of two suction points – one at the fixed and one at the movable side.

As an option, you can also control other commercially available valves.
