

# Automatic Aspiration with the TAS Universal Cleaner:

**The best just got better**

## More performance, less effort. Introducing TAS with Automatic Aspiration.

Unlock more efficiency and cost savings with the new Automatic Aspiration feature for the TAS, making the industry's benchmark cleaner even more effective. With a new system of aspiration that automatically adjusts, TAS now maintains throughput and cleaning quality, compensating for changes in your product flow automatically and without human intervention.

The TAS universal cleaning machine is the leader in separating impurities from good product, but achieving the perfect separation cut has always depended on precise air settings. Too much air can cause loss of good grains, while too little leaves impurities behind.

The new Automatic Aspiration system solves this by detecting the volume of good product in the aspiration channel and fine-tuning airflow automatically. It maximizes yield, minimizes maintenance, and reduces the need for skilled labor or external support. With remote monitoring and automatic pressure adjustment, it ensures stable, efficient performance and continuous operation across your process line.

### Unmissable benefits

#### Supreme efficiency:

Automatically adjusts airflow to product flow for consistent yield and cleaning quality – no manual intervention needed.

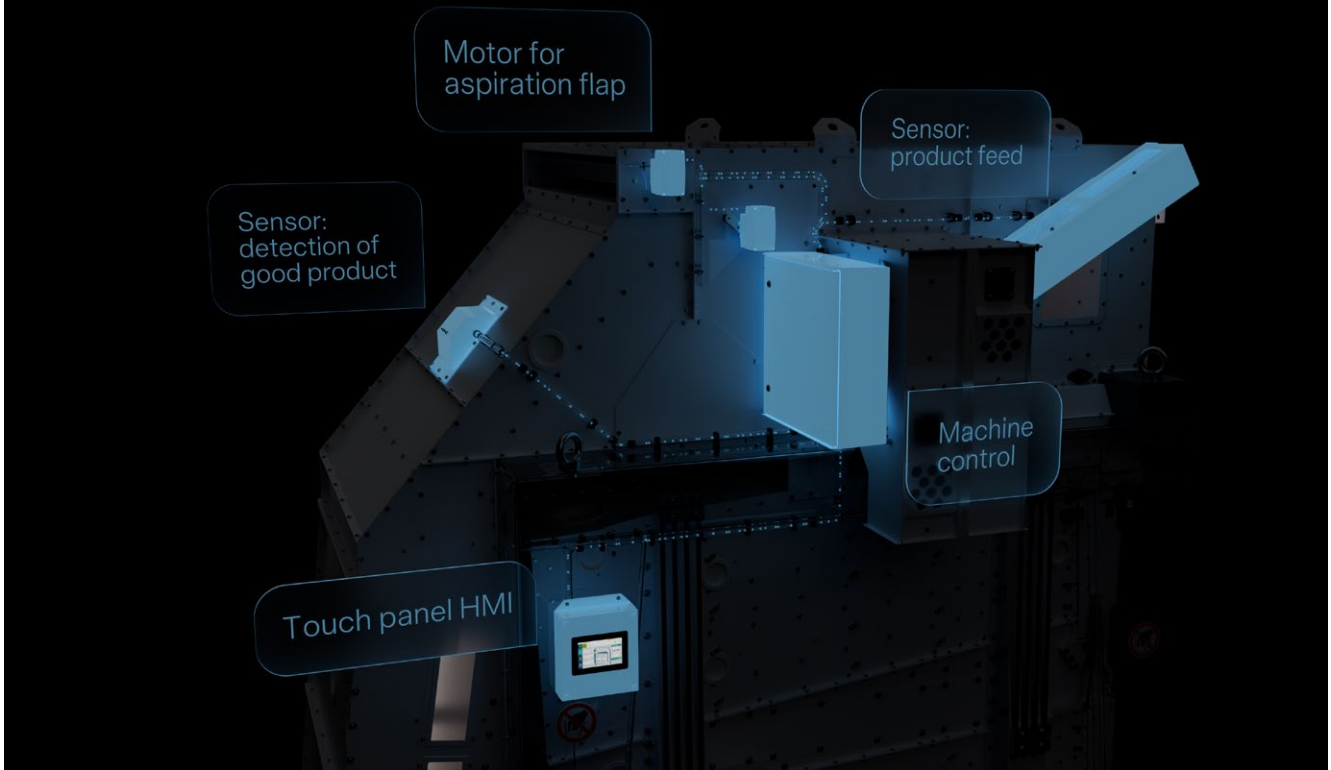

#### Easy operation, less stress:

Reacts instantly to pressure or air volume changes, ensuring stable, continuous performance with minimal maintenance.

# Unlock Automatic Aspiration

With the TAS Universal Cleaner

The new Automatic Aspiration feature takes the TAS cleaner's efficiency to the next level, automatically adjusting airflow to maintain consistent throughput and cleaning quality.

By detecting product volume in real time, it maximizes yield, minimizes maintenance, and reduces operator involvement – ensuring stable, high-performance cleaning with less effort, and greater control.

“For decades TAS has been the benchmark cleaner - now, we are excited to announce a massive update to the aspiration feature, this change revolutionizes the autonomy and power of TAS, bringing a new level of performance.”
