

Heat up your sesame sorting performance.

SORTEX® heated chute upgrade.

Reconfigure your systems. **Increase your processing efficiency.**

Traditionally, oily and sticky products such as sesame seeds can severely limit machine process capacity and work flow while residue build up increases the need for optical sorter maintenance, cleaning and operator supervision.

Widely used agents such as arrowroot or cornflour can clump produce which limits product visibility to optical sorters, decreasing efficiency and final product quality.

Installing a Bühler heated chute system brings multiple benefits to the hulled sesame seed processor. Developed to maintain a consistent temperature across all chutes, it has been proven to help eliminate residue build-up by up to 95% while improving overall product accept quality and yield.

Product clumping is greatly reduced improving camera visibility and defect removal, while the elimination of seed jumping, improves ejector accuracy, reducing wear and air consumption, ultimately improving profitability.

Key advantages and benefits:

- Reduced chute deposits = less cleaning = less downtime
- Necessity for operator monitoring is lowered
- Improves reject ratio by limiting rice jumping
- Decrease air consumption which in turn equals a decrease in energy consumption

Available now for SORTEX A, S & Z optical sorters to improve efficiency and hygiene to deliver maximum profitability.
